

Sentinel

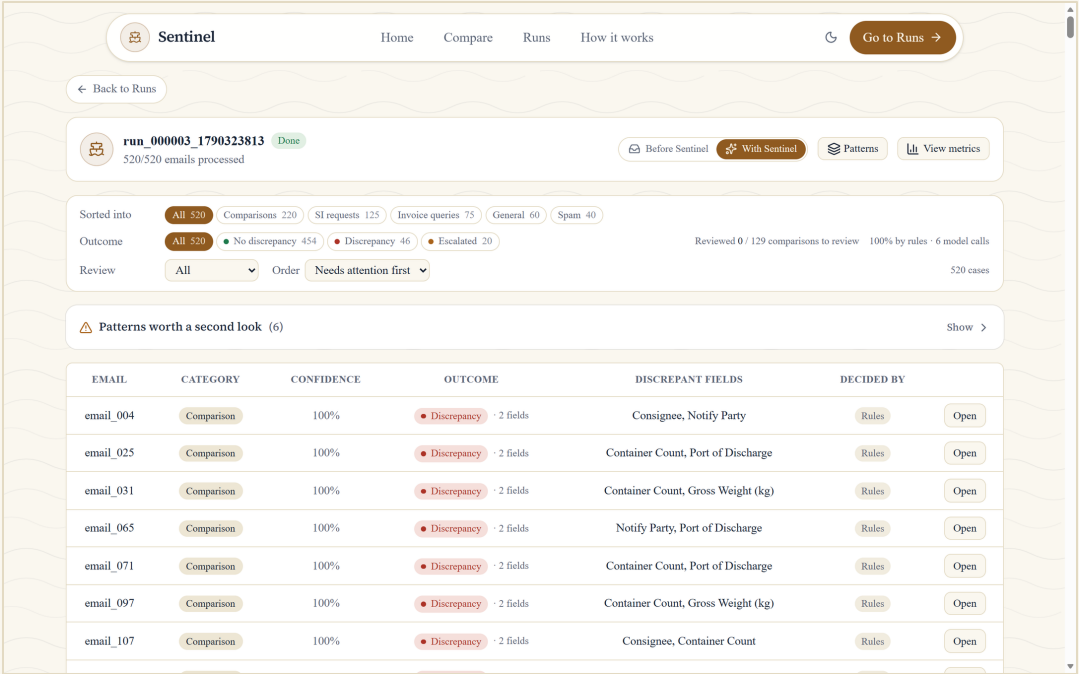

Every answer comes with its evidence.

A document checker that is confidently wrong is worse than none: nobody goes back to look. Sentinel never reports a discrepancy it cannot prove.

DuoCode

Lim Yee Teng · Tang Chye Fong · Asia Pacific University

duocode-sentinel.vercel.app
github.com/TCF1209/duocode-sentinel

The organisers' 520-email inbox, run live on the deployed site.

Four things the desk needs - the fourth matters most

01 Classify

Tell message types apart: comparison requests, new SI requests, invoice queries, general mail, spam.

02 Extract

For comparison requests, read the SI and BL attachments and pull the matching shipment fields.

03 Compare

Surface any mismatched fields, showing the SI and BL values side by side.

04 Ask for help

When it can't finish on its own, escalate to a person with full context instead of guessing or failing silently.

The problem statement's four capabilities, in its own words.

~4 min

to check one SI/BL pair manually - seven fields, two documents

~20 s

to triage one email in a shared inbox of five kinds of mail

1 field

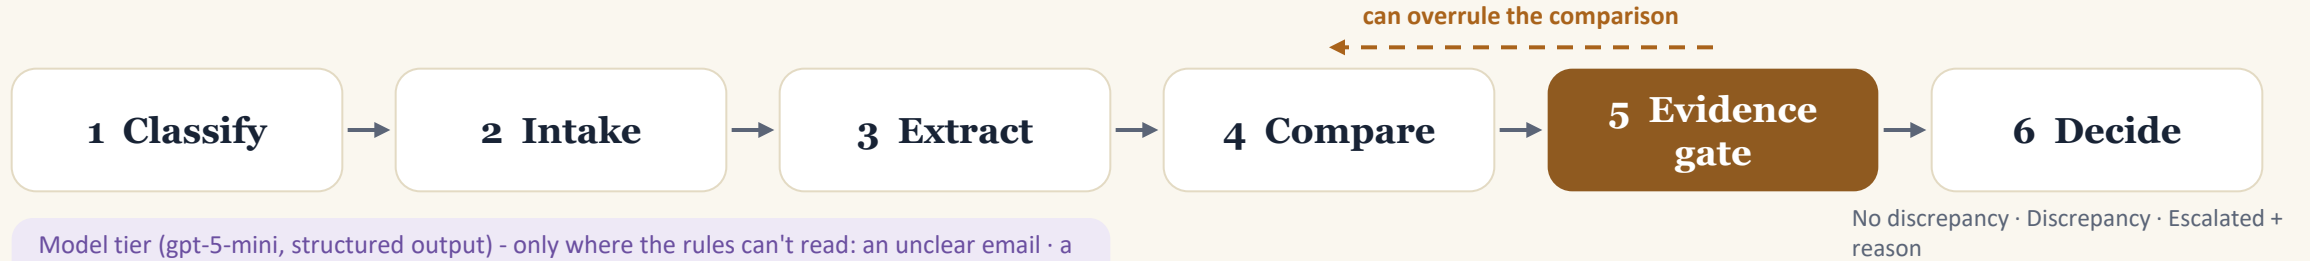

missed becomes a correction, a delay, rework

Our own estimate, not a measurement.

The fourth case

Sometimes the check cannot be done: a scan with no text layer, a blank field, the wrong document. That goes to a person with the reason and the next step. It is never guessed.

Six stages, one direction - and a gate that can say no

Values exactly, never by similarity

APRIL FINE PAPER TRADING and APRIL FINE PAPER TRADING (MIDDLE EAST) FZE are two different companies in this data. Labels are matched by meaning; values, exactly.

Our cost: sometimes a person checks a pair that was fine. The alternative's cost: a wrong Bill of Lading, cleared silently.

Rules first, model second

The model is asked only where the rules admit they cannot read, and every case records which one answered.

Cost: with the model tier off, a label we have never seen is escalated, not read.

One stateless library

No web server or database inside the pipeline. The API, the command line and the tests run the same code, so what is scored is what you see.

Cost: no database yet - reviews live in memory until the one-file change.

Deployed and scaling, as built

Vercel (Next.js dashboard) -> Render (FastAPI + the pipeline, one Docker container, non-root user) -> OpenAI. Under 3 ms per email on one laptop core. All state sits behind one class (store.py): a database is a one-file change, then throughput is more copies of the same container.

What to watch for

Chye Fong · how it works

- 1** The whole inbox - 520 emails, model tier on, live on the cloud
End-to-end · Technology
- 2** Before Sentinel / With Sentinel - the inbox as a clerk gets it
Effectiveness
- 3** One case through the six stages - the line under every value
Architecture
- 4** Compare: model off, then on - it escalates, then it reads
Technology · Robustness

Yee Teng · how a reviewer uses it

- 5** Patterns across the inbox -> this shipper's history on the field
Differentiation
- 6** Edit a value -> compared again -> reply drafted from the decision
User experience
- 7** A scan: the transcription is evidence, never a verdict
Technology · Robustness
- 8** Amended documents arrive -> the same check runs again
End-to-end

If the venue network fails: the same inbox runs on the laptop with no network at all - only the model beats change. Screenshots of every beat follow the closing slide.

How we know it holds

Not memorised

1.0000 on the organisers' scorer - and on three more datasets from seeds we never developed against. 225 planted discrepancies, each caught with the exact field set; 80 of 80 escalations correct.

Attacked ourselves

16 kinds of damage, 3,008 perturbed documents, 20,496 field reads, no answer key. 13 kinds change nothing; 0 invented discrepancies in any. Under OCR damage, silently wrong values: 982 -> 0.

Outside the organisers' data

Real carrier forms, real scans, archived bills of lading, 14,326 real emails. It cannot read most real form layouts yet - and made 0 wrong automatic decisions: every one went to a person.

Engineering

763 tests, 0 failing; CI on every push to main. Runs with no key and no network. A \$2 model cap per run - when it is spent, hard cases escalate. The container runs as a non-root user with no secret inside.

What we haven't fixed

email_145: a wrapped party name cut to exactly what the other document says. One real discrepancy in 3,008 perturbed documents is reported as consistent.

The obvious guard would flag 114 of 124 SI/BL pairs (92%) - worse than the gap. So it stays open, and written down.

A defect we hide is worse than one we miss.

Also written down: most real form layouts are not read yet; no database, accounts or mailbox connector yet.

A perfect score on the data you were handed proves you didn't memorise it - not that the reader works. So we went looking for the failures ourselves.

One desk first - and three numbers to hold

The inbox already carries four desk codes: AFEMY 35 · AIE 30 · AFRT 29 · AFPTME 22 emails. Sentinel runs beside one desk's existing check until these hold for a full cycle of its carriers:

Measure	Today, on this inbox	The pilot watches
Escalation rate	20 of 220 requests (9.1%), every one correct	that it stays correct as new templates arrive
False discrepancies	0 of 46	the weekly number
Reviewer minutes per escalation	not measured yet	the pilot's first new measurement

Cost: on this inbox the rules decide every email, so a run costs nothing. Where the model is needed: \$0.0013 per document (measured), with a \$2 cap per run.

Built since round one

Pattern alerts across the inbox, and throughput and cost at volume - two of the five items on our round-one roadmap, now live.

Next, in order

- 1

Per-desk rules

a label table and an escalation policy per desk, picked by the desk code the inbox already carries
- 2

Corrections feed the label table

every confirmed correction is a labelled example of wording we could not read - the one place this system should learn
- 3

The database, then accounts

one file for the store; accounts and a mailbox connector after it

Every answer comes with its evidence.

Sentinel, by DuoCode

Every value found again in its document

rule-read or model-read, before any verdict is reported

Attacked by its own authors

3,008 damaged documents, no answer key - the failures published, one still open

Tested outside the organisers' data

real forms, real scans, real emails - what it couldn't read went to a person

What a person would do with this inbox

520 emails to read 124 SI/BL pairs to find among them 868 fields to check manually ≈ 11.2 h of work

Estimate: 20 s per email, 4 min per pair.

Sentinel: 4.9 s

 Try it: classify the first 5 emails (the Your call column). The clock starts at your first pick.

Filters, ordering and patterns come with Sentinel.

Re: AFEMY - MOMBASA_KENYA - ONE(SINF87558867) - 5RCY-36057 - 5250076627 - VITAL SOLUTIONS PTE. LTD. - DP

Hello,

WORDING · TEMPLATE

Thank you for your email.

WHAT HAPPENED · LOCKED

We compared the draft Bill of Lading against the Shipping Instruction and found discrepancies in the following fields.

FROM THE DOCUMENTS · LOCKED

- Container Count: SI says "1 x 20'GP", draft BL says "3 x 20'GP"

REQUEST · LOCKED

Could you please confirm which value is correct so we can finalise the Bill of Lading?

WORDING · TEMPLATE

Thank you.

Regards,

Wording by AI

Formal

Reword with AI

8 • A scan: transcription is evidence, not a verdict

No text layer, so Sentinel did not decide. The model's transcription is shown for the reviewer to check against the image; here it misread 'AL GURG' as 'ALGURG' on the BL - which is exactly why a person ticks what was verified.
